ACKNOWLEDGEMENT

We extend our sincere gratitude to **Er. Sunil Kumar Ram**, Deputy Head of the Department of BCA at **Aryan School of Engineering and Management**, for providing us with the opportunity to undertake and present this project report on" **STUDENT RECORD MANAGEMENT REPORT**". His constant support and encouragement have been invaluable. We are deeply thankful to our respected mentor for his expert guidance, constructive feedback, unparalleled suggestions and support throughout the development of this project. We also acknowledge the valuable contributions and encouragement of the teaching and non-teaching staff of **Aryan School of Engineering and Management**. Finally, we would like to thank our friends and family for their constant motivation, patience, and support, which played a vital role in the successful completion of this project.

Group members:

ABSTRACT

Student Record Management System refers to a computer software application that has been created in order to facilitate the management of student's information. The purpose of the development of this project is to eliminate manual processing of information, ensure efficiency in handling of records, minimize errors and enhance security of students' information. Through this project, it becomes easy for administrators to manage, retrieve, update and enter the information of students such as their personal information, academic performance and results.

The project is designed to make users work effectively through an efficient and simple user interface. Errors made during manual processing of information are reduced considerably since the SRMS is a reliable means for information handling in learning institutions. Data management in learning institutions is facilitated in an effective way by the SRMS project.

KEYWORDS:

- Student Record Management System
- Database Management
- Student Information
- Data Management

CHAPTER 1: INTRODUCTION

Student Record Management System is an environment where all the record of students in the institution is managed. It is done through the automated computerized method. Conventionally this system is done using papers, find and blinders.

This system saves the time of the students and of the administrator. It includes process like registration of the student, showing details of students, adding course, grade records etc. Based on their maintenance records.

This system reduce the cost and workforce required for this job. It is easy to handle and updating at the same time. The project intends to introduce more user friendliness in the various activities such as record updating, maintenance and searching can be accomplished by using the ID and password of the student with all the details being automatically generated. These details are also being promptly automatically updated in the master file thus keeping the record absolutely up to date.

1.1 Background

The Student Report Management System is developed to manage student the information of the students in an efficient using the computer technology. The records of students were kept manually in register and files which were time consuming and chances of errors were more. This system aids in storing, updating, searching and deleting student's records digitally.

The project is developed in C programming languages. It includes the basic concepts of C like structure, functions and file handling.

1.2 Problem Statement

Handling student records manually is a difficult and time consuming task. Searching and updating records in big files may lead to data loss and errors. Hence there is a need of a computerized system to handle the student information in an accurate and efficient manner.

1.3 Objectives

This project is undertaken with the following key objectives:

- To maintain student records digitally.
- To reduce manual paperwork.
- To add, update, search, and delete records.
- To improve accuracy and save time.
- To learn file handling concept in c programming.

1.4 Application

Student Record Management system is employed in educational institutions like schools, colleges, and universities to help with the efficient management of the student records. With the aid of the record management system, education institutions are able to maintain records of students including personal records of students, attendance record, marks scored, results of examinations, among others, in electronic format. The Student Record Management System enhance efficiency of record keeping as well as accuracy and minimizes errors that come with manual processing.

1.5 System Requirements

The Student Record Management System requires both hardware and software components for proper operations.

1.5.1 Software Requirements

- Operating system: Windows
- Programming Languages: C
- Compiler: Turbo C/ Code: Blocks / Dev C++

1.5.2 Hardware Requirements

- Computer or Laptop
- Minimum 2 GB RAM
- Keyboard , Mouse and storage device

CHAPTER 2: LITERATURE REVIEW

A Student Record Management System is a software application used to store student information in digital form. Educational Institution use computerized system to minimize manual work and increase efficiency. [1]

The reason to use C programming language for this project is because it is simple, fast and suitable for beginners to learn programming concept such as structure, functions, array and file handling.[2]

The prior systems were mostly manual and paper based on databases and graphical interface. This project is based on simple console implementation for educational purposes.

CHAPTER 3: METHODOLOGY

The Student Record Managements System outlines the steps taken to create and manage the system. The project is build using the C programming languages and follows a process for storing and maintaining student information digitally. The system gathers details like student name, roll number, address, and marks from the user. It performs various tasks such as adding, displaying, searching, updating, and deleting student records. Structures and functions help to organize and manage the data effectively. File handling is a key technique used in this project to provide permanents storage for student records. It allows data to be saved in files, ensuring that information remains accessible even after the program is closed. The system is tested by inputting different student records to verify that all functions work properly. Overall, the methodology offers a simple and organized way to develop an efficient Student Record Management System.[3] [4]

3.1 Main functions of the system:

- Add Record
- Display Record
- Search Record
- Modify Record
- Delete Record

3.2Algorithm

Step 1: Start

Start the program.

Step 2: Create Student Record Storage

Create a file, array, or database to store student information.

Step 3: Display Menu

Display the following options:

1. Add Student Record

2. View Student Record
3. Search Student Record
4. Update Student Record
5. Delete Student Record
6. Exit

Step 4: Enter User Choice

Input the user's choice.

Step 5: Perform Operation

Add Record

- Enter student details.
- Save the record.

View Record

- Read all student records.
- Display the records.

Search Record

- Enter Student ID.
- Search the record.
- Display the result.

Update Record

- Enter Student ID.
- Search the record.
- Modify the required information.
- Save updated record.

Delete Record

- Enter Student ID.
- Search the record.
- Delete the record.

Exit

- Close the program.

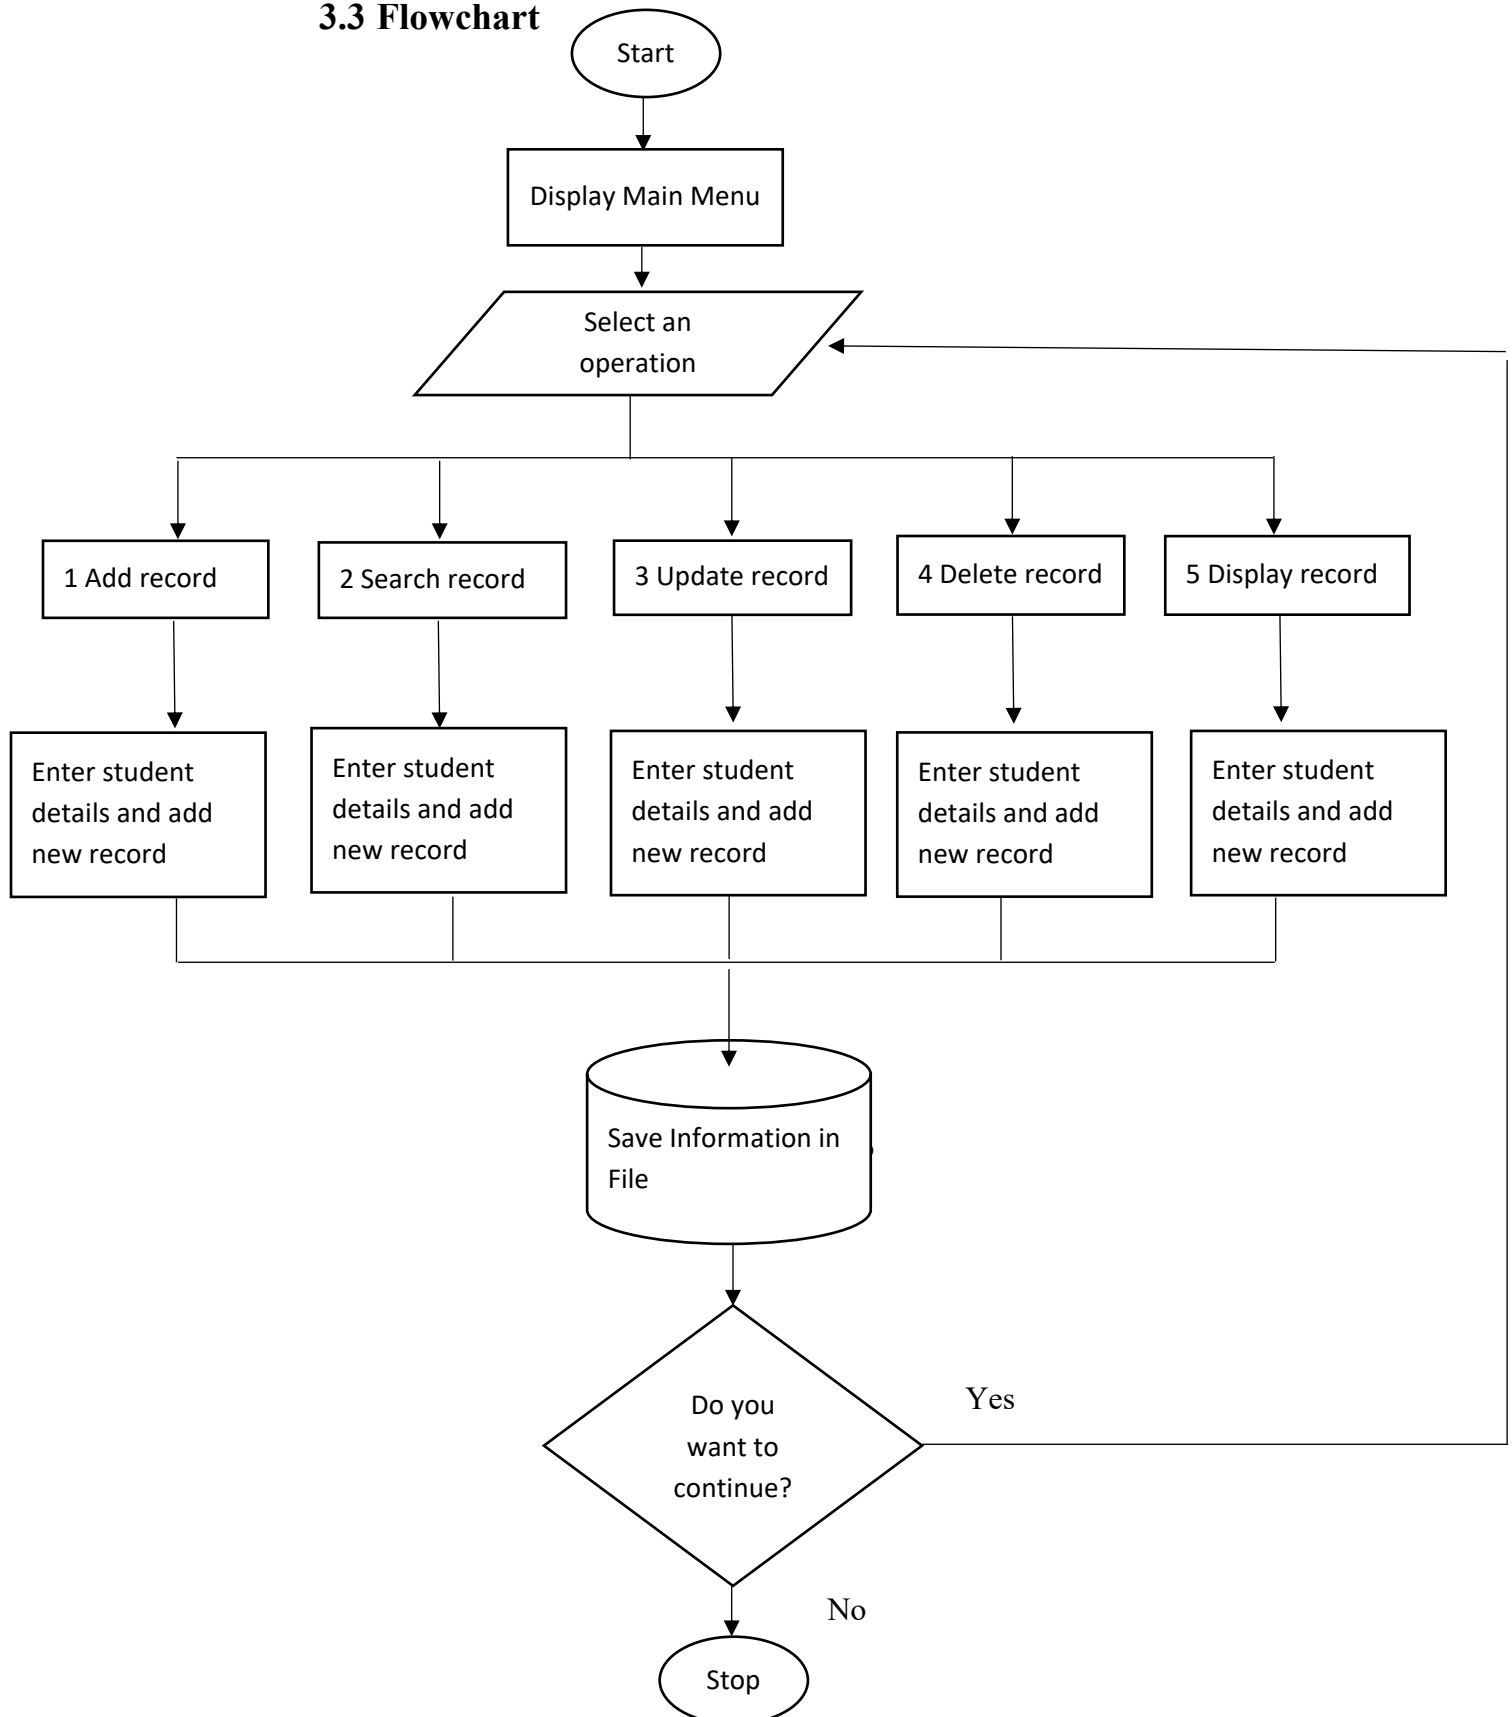

Step 6: Repeat

Repeat Steps 3 to 5 until the user selects Exit.

Step 7: End

Stop the program.

3.3 Flowchart

CHAPTER 4: EXPECTED OUTCOMES

Outcome Expected from Student Record Management System

The expected result of the implementation of the Student Record Management System would be the ability to organize the student record data in a systematic and effective manner. This can be done through the easy addition, viewing, searching, updating and deleting of the records of the students.

Some points are:

- Student record storage can be done effectively.[5]
- Adding new student records is quite easy for users.
- All student records can be shown easily and quickly.
- Student's records can be searched using their IDs.

4.1 CONCLUSION

The Student Record Management System is an effective system for managing student information in a simple and organized manner. It helps users to store, search, update, and delete student records easily and efficiently. The system reduces manual effort, saves time, and improves the accuracy of data management. Overall, the project provides a reliable and user-friendly solution for maintaining student records in schools, colleges, and other educational institutions.
